3. ATTACHING EMITTER TO COMPONENT

> Peel off the adhesive cover and affix the emitter to the center of the IR sensor window on the controlled component's front panel

> In some cases, it may be difficult to find the location of the IR sensor on the component. Consult the owner's manual of the unit for the IR sensor location.

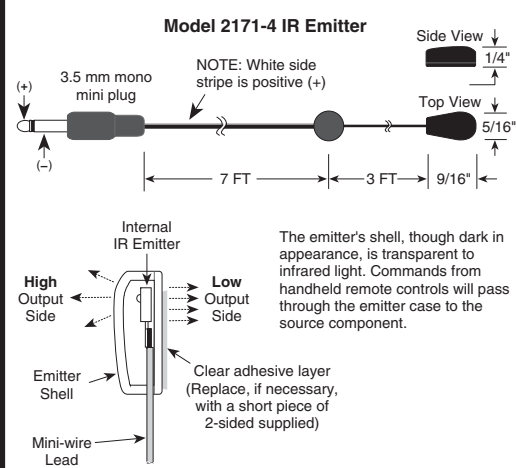

1. PRODUCT DESCRIPTION

The Model 2171-4 Single-head Infrared (IR) Emitters are supplied in a package of four and are used with the Linear Encore Multi-Room Audio Distribution System, ENC-SIWP source input or ENC-LIWP local input wall plates. These generic emitters can also be used with Linear's video hubs, 2100A and 2010 in-wall interface, or with a 5500 series IR enabled modulator connected to a video hub.

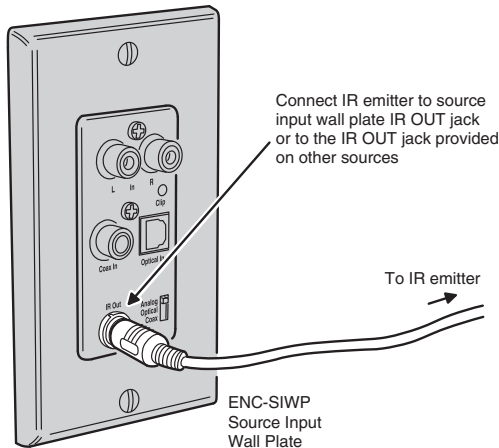

Each emitter contains a tiny infrared LED housed in a miniature, injection molded plastic shell. The emitters have adhesive backing for mounting. An emitter can be installed directly on the IR sensor window of the controlled source component or in a suitable nearby location.

An IR emitter repeats IR remote control signals received at a room station keypad or IR target from a handheld IR remote control. When an IR signal is detected at a target, the signal is sent to the IR OUT jacks on the wall plates or device. An IR emitter connected to the IR OUT jack, repeats the same IR signal to the source component. This allows IR remote control of source components that are located away from the IR target.
